

Mōhio

Product Overview RocketM

What is RocketM?

RocketM is a data integration tool to extract, transform and load external data into Mōhio.

RocketM is based on the principals of having a live information available at the PHO level from data collected across a disperse network of differing PMS systems.

Practice Management Integration

RocketM can collect data from MedTech-32, Medtech Evolution and MyPractice. The information collected can include classifications, recordings, lab results, clinical notes, appointments.

Health Target Example

RocketM will detect a GP entering a classification for Smoking Brief Advice into their Practice Management System (PMS); and within 10 minutes this will be visible to the Mōhio platform. This can support live reporting or dashboards showing National

Health Target performance at a PHO or DHB level.

Powerful Queries

RocketM is fully customisable, different queries can be run on different schedules, different times of the day and queries can be switched on or off per practice. For example you may only have a specified group of practices wishing to share additional data for a particular project.

Simple To Use

General practice users do nothing; RocketM runs in the background of their server.

At the PHO level RocketM is also a set and forget system. Once queries are selected remotely via the web interface the system then runs constantly in the background at both the General Practice site and within Mōhio.

Data will then seamlessly and constantly flow from the PMS into the Mōhio platform. There is no need to manually run queries or wait for results overnight.

Not Just Primary Care Data...

RocketM can also be configured to point to any SQL/ODBC database. This means it can collect accounting data or data from other systems your organisation or contracted providers may be using.

RocketM can also make use of Web APIs if available to collect information from web based systems.

By using RocketM a PHO can know within 10 minutes that a GP entered a 'Smoking Brief Advice' classification for a particular patient within their practice.
